Rafiq — Employee AI Companion · Submission

Team: Muhammad Omaid — Magnus Mage (dev team) · **Challenge:** Ignyte × Emirates — Employee AI Companion · **Repository:** https://github.com/0xv3nm09/rafiq-companion *(private during review)*

One line

An employee-owned AI companion that carries a person through **both** required journeys — onboarding and internal mobility — knows where they are against service-level targets, answers policy questions with inline citations, starts and routes routine requests, and catches friction **before** it escalates — on a consent-first, in-region, UAE-sovereign footing.

What the submission contains

Deliverable	Where / link
Working prototype — runnable repo with setup steps	https://github.com/0xv3nm09/rafiq-companion · start guide below · CI runs the 39-test suite on every push
Demo video — 1:46 (≤3:00), both required scenarios, narration + burned captions	Web link: https://github.com/0xv3nm09/rafiq-companion/releases/tag/demo-video · also uploaded as a file with this entry
Solution note — 2 pages incl. consent, privacy, human oversight	Web link: https://github.com/0xv3nm09/rafiq-companion/blob/master/docs/rafiq-solution-note.pdf · also uploaded as a file with this entry

60-second start guide

Prerequisites: Python 3.12/3.13 and uv — install with `curl -LsS https://astral.sh/uv/install.sh | sh` (Windows PowerShell: `irm astral.sh/uv/install.ps1 | iex`); or plain pip in a venv: `pip install -e ".[dev]"`
`uv sync` · `uv run uvicorn app.main:app --port 8000` (or: `make run`) · `uv run pytest -q` (39 tests)

Open **http://localhost:8000** — no API keys, no cloud; the synthetic pack ships in the repo and no data leaves the machine. Then, every step one click from the side rail:

- **Home** opens on E0421 (Aisha, onboarding day 5) with the laptop blocker already flagged — before she asks.
- **Ask Rafiq** → *Where is my laptop?* → computed answer citing policy ONB-07 → *Chase it for me* → a complete handoff card goes to the named owner.
- **My journey** — SLA timeline with real-process hints; **My data** → toggle pulse consent live; the audit log records every action.
- Role buttons: **Manager** (risk-sorted team, pulse-free) · **HR** (early-warning queue + handoff inbox) · **Owner** (IT Service Desk inbox, acknowledge/resolve).
- **Where journeys stall** — the aggregate view · **AR** — full Arabic RTL flip · **Viewing as** → **E0422** — the stalled-transfer scenario citing MOB-01.

Guardrails, stated as built

Synthetic data only, never uploaded to services that retain or train on it · the companion works for the employee — the manager view structurally contains no pulse data · sentiment used only with opt-in consent, revocable, employee-visible · every intervention routes to a named human owner · every policy answer cites its source, and when unsure the companion says so and hands off.

If accepted

The **Magnus Mage dev team** carries Rafiq forward: the pilot swap is data and read-only connectors (the loader accepts the official pack in `data/pack/` with zero code change), the sovereign model path (Falcon-H1 Arabic / JAIS on-premise, in-region) is a one-file swap, and the deterministic core — the part a pilot can trust — stays as is.
