Rafiq — Employee AI Companion

Oct 14, 2026 · @M Omaid

Challenge: How might we give every new or moving employee a secure AI companion that knows where they are in their journey, resolves routine needs, and routes issues to the right owner before they escalate?

Submitted by: Muhammad Omaid — Head of AI, Magnus Mage (solo developer)

Deliverables

#	Deliverable	Details	Link
1	Working prototype	Runnable repo with setup steps; CI runs the 39-test suite on every push	github.com/0xv3nm09/rafiq-companion
2	Demo video	1:46 (⩽ 3:00), both required scenarios, narration + burned captions — also attached as a file	Release: demo-video
3	Solution note	2 pages, including consent, privacy and human oversight — also attached as a file	Release: demo-video

The demo walks two employee scenarios end-to-end: a **day-5 unissued laptop** (detected, answered with the cited onboarding policy, chased, and escalated to the named IT owner) and a **stalled visa on an internal move** (routed to the named HR Business Partner, with nothing auto-processed).

Team and next steps

Submitted by **Muhammad Omaid**, Head of AI at **Magnus Mage**, as a solo developer. If awarded, the **Magnus Mage** development team carries Rafiq into a next-quarter pilot — hardening it, connecting one journey to live read-only systems, and standing up governance (DPIA, audit, named owners).

Submission at a glance

2 **Journeys** onboarding + mobility	**5/5** **Required capabilities** all delivered	**17** **Bilingual policies** English + Arabic
~200 **Synthetic employees** in the data pack	**39** **Automated tests** CI on every push	**0** **API keys needed** runs fully offline

key figures

What we built

1. **Knows the journey stage** — events checked against target SLAs; “day 5, laptop not issued” falls out of one rule.
2. **Answers policy questions, cited** — grounded retrieval returns the source policy and a confidence score; unsure → it says so and hands off.
3. **Starts and routes requests** — produces a structured handoff card for the named owner.
4. **Spots friction early** — overdue events, breached SLAs and opt-in pulse; the employee sees it first.
5. **Escalates to a human** — named owner with a summary; sensitive topics always go to a person.

Also: Arabic + English with RTL, a journey timeline, a consent panel, an append-only audit log, a manager view (no pulse data) and a “where journeys stall” view.

Responsible AI, privacy and human oversight

- **Opt-in consent** — pulse is excluded from all signals unless opted in; revocable instantly and confirmed.
- **The employee sees their own data** — a “what we hold about you” panel plus an append-only audit log.
- **Human handoffs** — a named owner on every intervention; sensitive topics always route to a person.
- **Not a monitoring tool** — the manager view holds no pulse data, PII is redacted, and nothing is used for performance or discipline; in-region (PDPL-aligned).

Deployability, reuse and pilot readiness

Deployable and reusable. Open-source and self-hostable, running fully offline with no API key; a UAE-sovereign model path (Falcon / JAIS). Policies and journey maps are configuration, so another government entity adopts Rafiq by swapping those inputs. Connectors run read-only in a pilot, thresholds live in config, and the deterministic core is pilot-safe.
